

USE OF MYCOSPORIN TYPE AMINO ACID (M-GLY) IN THE PREVENTION OF OXIDATION OF COSMETIC AND PHARMACEUTICAL PRODUCTS

Description:

Free radicals are associated with a wide range of pathologies and diseases such as Alzheimer's or Parkinson's and conditions related to sun exposure such as the appearance of cataracts, photoaging, inflammatory episodes and neoplasms. They are also responsible for the oxidation of fats in food, which is the most important form of deterioration after alterations produced by microorganisms. With oxidation, rancid odors and flavors appear, color and texture are altered, and nutritional value decreases as some vitamins and polyunsaturated fatty acids are lost. In addition, the products formed in oxidation can be harmful to health. An antioxidant is defined as a substance that in low concentrations compared to an oxidizable substrate, delays or prevents its oxidation. Thus, the present invention presents the potential of the amino acid mycosporin, specifically of M-gly isolated from the marine lichen *Lichyna pygmaea*, for the prevention of oxidation or deterioration in cosmetic and pharmaceutical products.

Keywords:

[Amino Acids](#), [Pharmacology](#), [Mycosporins](#), [Antioxidant](#), [Cosmetic](#)

Sectors:

[Biotechnology](#), [Health](#)

Areas:

[Industrial](#)

Advantages:

The amino acid type mycosporin (M-gly) has antioxidant properties comparable to other commercial compounds with the advantage of being of natural origin.

Uses and Applications:

The present invention falls within the biotechnological, cosmetic and pharmaceutical sector for the prevention of deterioration due to oxidation of products, mainly of a cosmetic and pharmaceutical nature.

Patent Number: ES2301438

Applicants: Universidad De Málaga

Inventors: Francisca De La Coba Luque, Jose Aguilera Arjona, Felix Lopez Figueroa

Filing Date: 31/08/2005

Protection Level: National (Spain)

Processing Status: Spanish patent
